

# THE FULLY INTEGRATED RESERVOIR

Miguel Bosch

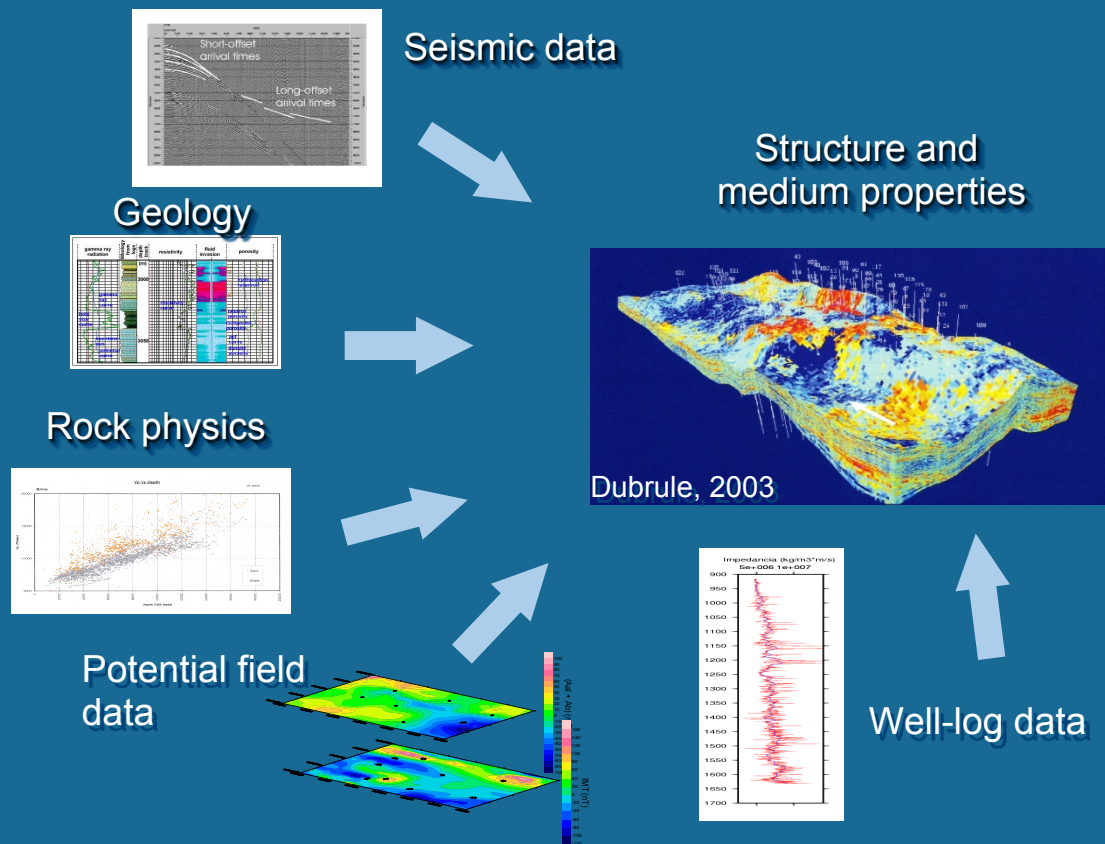

[miguel.bosch@infogeosciences.com](mailto:miguel.bosch@infogeosciences.com)

## *CONTENT OF THE TALK:*

- **Introduction**
- **The Full Static Reservoir project**
- **The Full Dynamic Reservoir project**
- **Our background and previous achievements**

# INFERENCE IN GEOSCIENCES

Turn around lapses for completing a full reservoir model is about 1 or 2 years:

- Specialists analyze separately and sometime sequentially the various information components

Integrated quantitative inference processes:

- Reduce time in a factor of 6
- Increase precision and reliability
- Provide uncertainty description

Methods involve:

- Inference knowledge networks
- Artificial intelligence

# KNOWLEDGE NETWORK (AI): FORWARD DIRECTION

Types

Graph

Posterior probability density

Plain /  
single

$$\sigma(\mathbf{m}) = c \rho(\mathbf{m}) L(\mathbf{m})$$

Posterior                      Prior                      Data likelihood

Complex /  
hierarchical

Model components are parameters describing reservoir (1) properties, (2) structure and (3) scale

Even more  
complex /  
knowledge  
network

Data components are parameters that are measured via surveys, instruments or direct observation

→ Modeled causal or statistical relationships across model components and data

# KNOWLEDGE NETWORK BASED INFERENCE:

AI plays a role in assembling the network, calibrating functions and solutions in each specific reservoir case

## Combined probability contribution

Primary ancestor Prior PDF  
 $m_3$  .....  $\rho(m_3)$

Inner model links Conditional PDF  
 $m_4 \rightarrow m_7$  ....  $\rho(m_7 | m_4)$

Data likelihood function  
 $m_9 \rightarrow d_2$  .....  $L(m_9)$

$$\sigma(m) = c \rho(m_1) \rho(m_3) \rho(m_2 | m_1, m_4) \rho(m_4 | m_3) L_2(m_2, m_4) L_1(m_1) L_3(m_3)$$

# TRADITIONAL VS PROPOSED TECHNOLOGY

1-2 years for elaborating a reservoir quantitative model

- Separate specialists, studies, software, contractors
- Sequential procedures
- Progressive integration of the information
- User over workstations

6 months for elaborating a reservoir quantitative model

- Smaller number of experts
- Joint procedures
- User over intelligent phones, workstations and 3D viewers
- Work assisted by the specialized cloud software

- Faster availability
- Improved precision
- Uncertainty description
- Automatic update

# THE FULL STATIC RESERVOIR:

## Developed components

- Seismic modeling
- Gravity modeling
- Geostatistical 3D modeling of model properties
- Markov chain technology
- Body geometric modeling

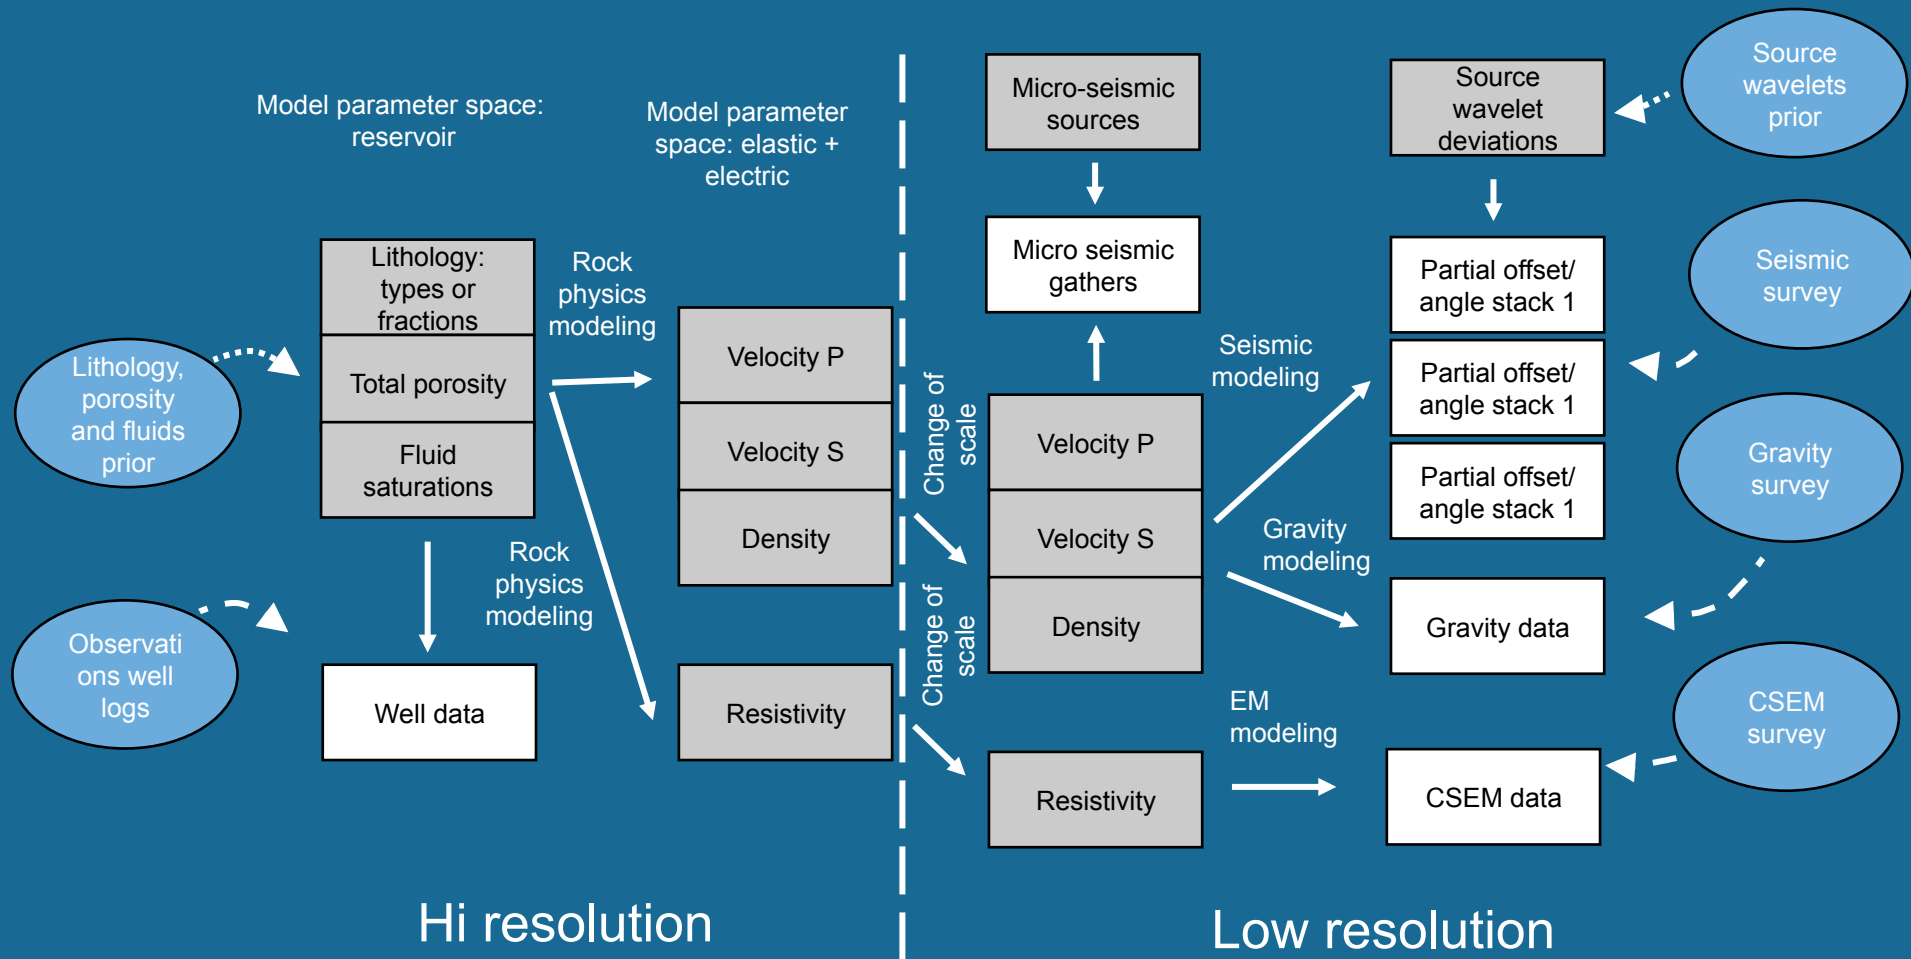

## Components to add/develop

- CSEM modeling
- Improved geometric modeling
- Output formats / user interphase

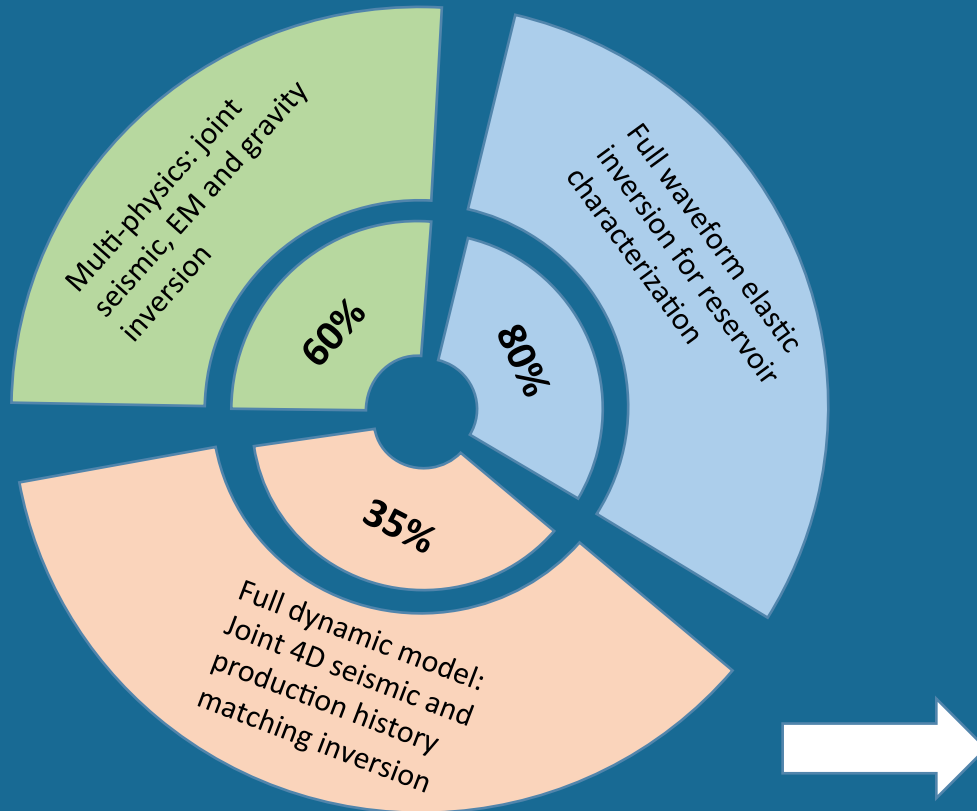

## Time/resources

- 12 months
- 2 – 3 professionals
- 80 - 90% station + 20-10% cluster
- Target investment of **2 M USD**

# FULL STATIC RESERVOIR: JOINT SEISMIC, CSEM AND GRAVITY INVERSION

# THE FULL DYNAMIC RESERVOIR:

## Developed components

- Seismic modeling and elastic inversion
- Geostatistical model for the properties
- Double scale model for the properties
- Geostatistical 3D modeling of model properties
- Body geometric modeling

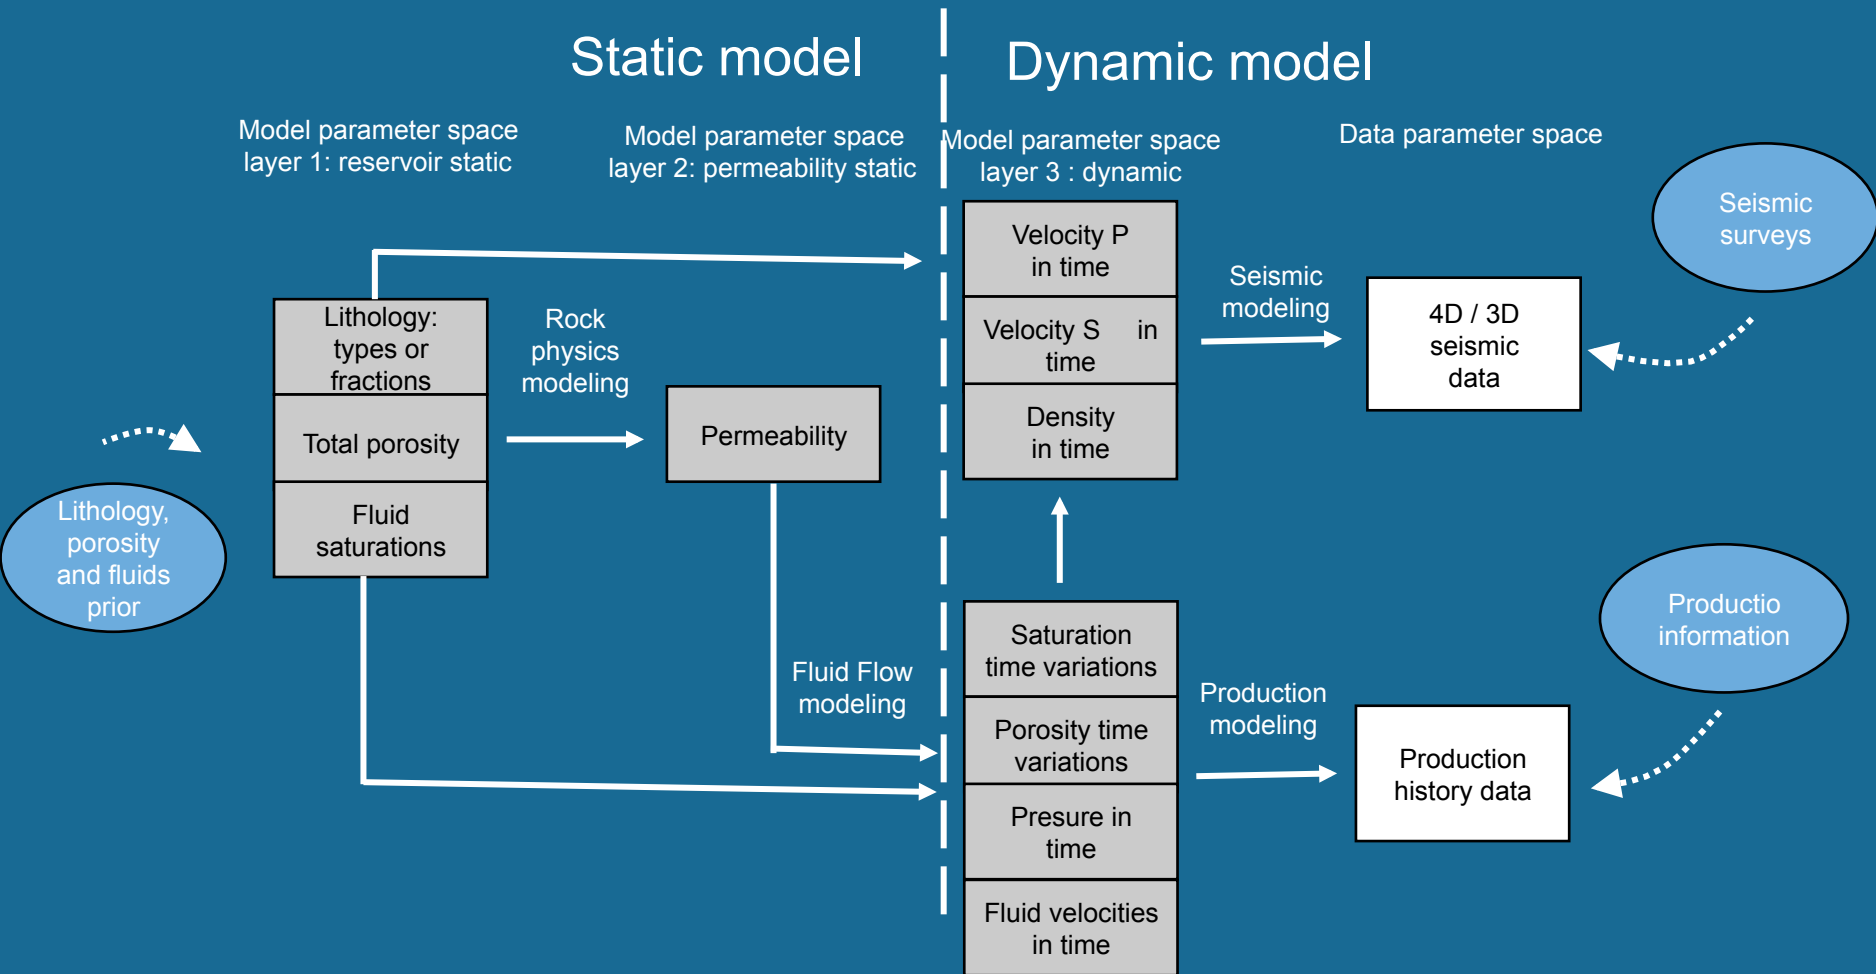

## To develop

- Fluid flow modeling
- Fluid flow inverse component
- Combination of the seismic and flow inversion

## Time/resources

- 12 months
- 4 – 5 professionals
- 50% station + 50% cluster
- Targeted investment of **3 M USD**

# FULL DYNAMIC RESERVOIR: JOINT 4D SEISMIC AND PRODUCTION HISTORY MATCHING

# DIRECTORS OF INFO GEOSCIENCES

miguel.bosch@infogeosciences.com

- Leads technical development to the oil and gas industry via Info Geosciences.
- Full professor and department head at the Central University of Venezuela - Retired
- Ph. D. thesis in France, Institut de Physique du Globe working with Albert Tarantola
- Member of the SEG, AAPG, EAGE, IAMG and AGU
- Associate Editor of the journal Geophysics for the area of Reservoir Geophysics

elsa.fernandez@infogeosciences.com

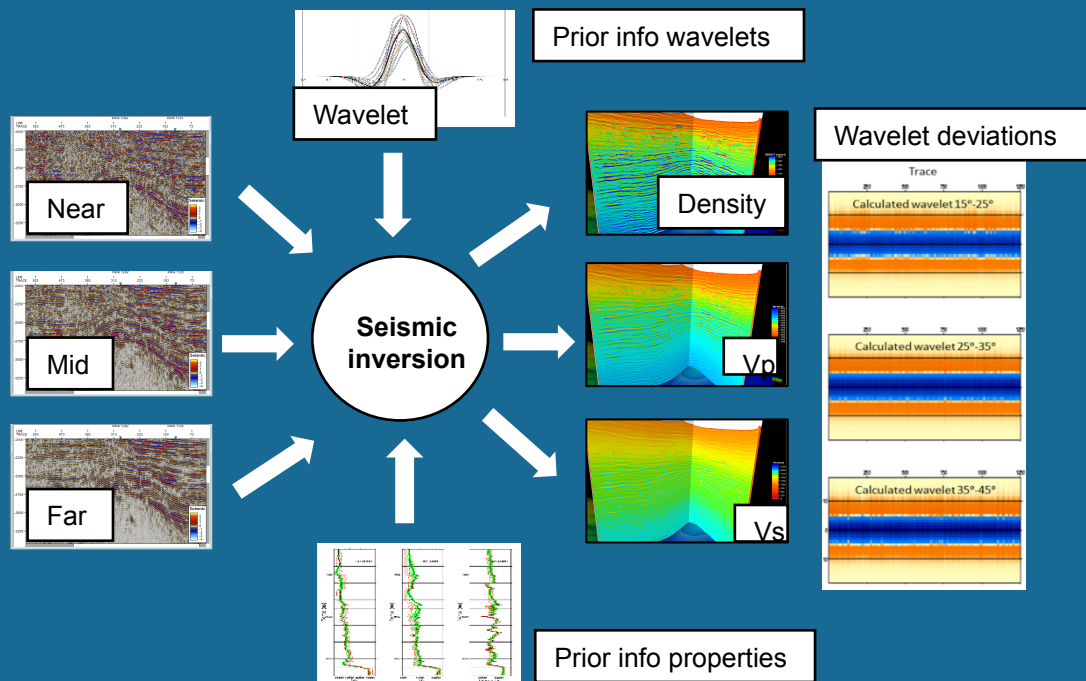

- Computer engineer from the Universidad Simon Bolivar in Caracas
- Master in Management of Technological Innovation in France, University of Paris VII
- Director of Informatics in the National Venezuelan Library
- Manager of Scientific Electronic Library Online Scielo – Venezuela

# **ADVANCED ELASTIC INVERSION (OPTIMIZATION)**

# PRESTACK MIGRATED ELASTIC SEISMIC INVERSION

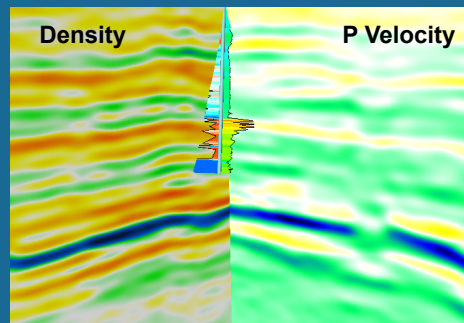

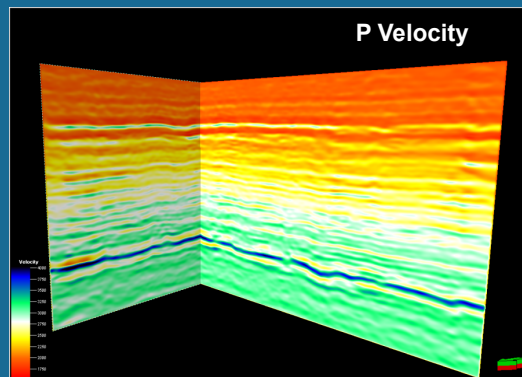

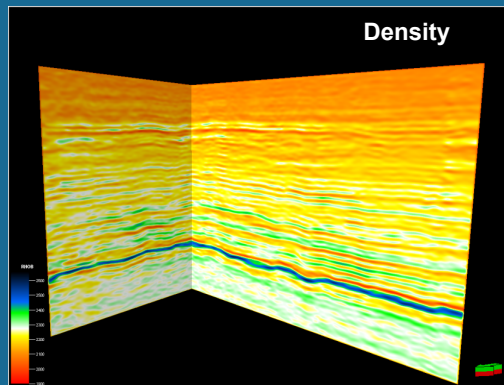

Our improvements:

- Appropriate joint resolution of the elastic parameters, including the mass density.
- Estimation of spatial source variations,
- Reflectivity calculated via exact solution of the Zoeppritz equations.
- Appropriate use of prior information based on well geostat characterization
- Optimized numerical solvers

$$f(\mathbf{m}, \mathbf{s}) = \underbrace{(\mathbf{d} - \mathbf{d}_{\text{obs}})^T \mathbf{C}_d^{-1} (\mathbf{d} - \mathbf{d}_{\text{obs}})}_{\text{Seismic data misfit}} + \underbrace{(\mathbf{m} - \mathbf{m}_{\text{prior}})^T \mathbf{C}_m^{-1} (\mathbf{m} - \mathbf{m}_{\text{prior}})}_{\text{Elastic properties deviations from the prior}} + \underbrace{(\mathbf{s} - \mathbf{s}_{\text{prior}})^T \mathbf{C}_s^{-1} (\mathbf{s} - \mathbf{s}_{\text{prior}})}_{\text{Source parameters deviations from the prior}}$$

# THE LLANOS BASIN IN COLOMBIA:

Target sand basal sand  
characterized by low density

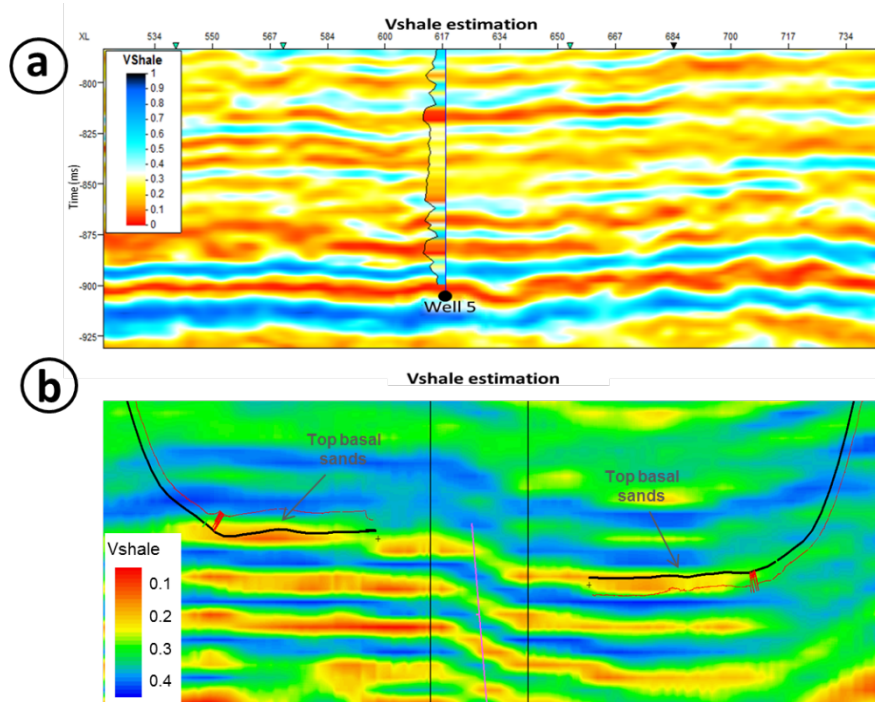

Oil bearing sands  
characterized by low  $V_p/V_s$   
and low  $V_p$

# SEISMIC LITHOLOGY ESTIMATOR FROM MASS DENSITY

Estimated shale fraction

Seismic + well info

Seismic

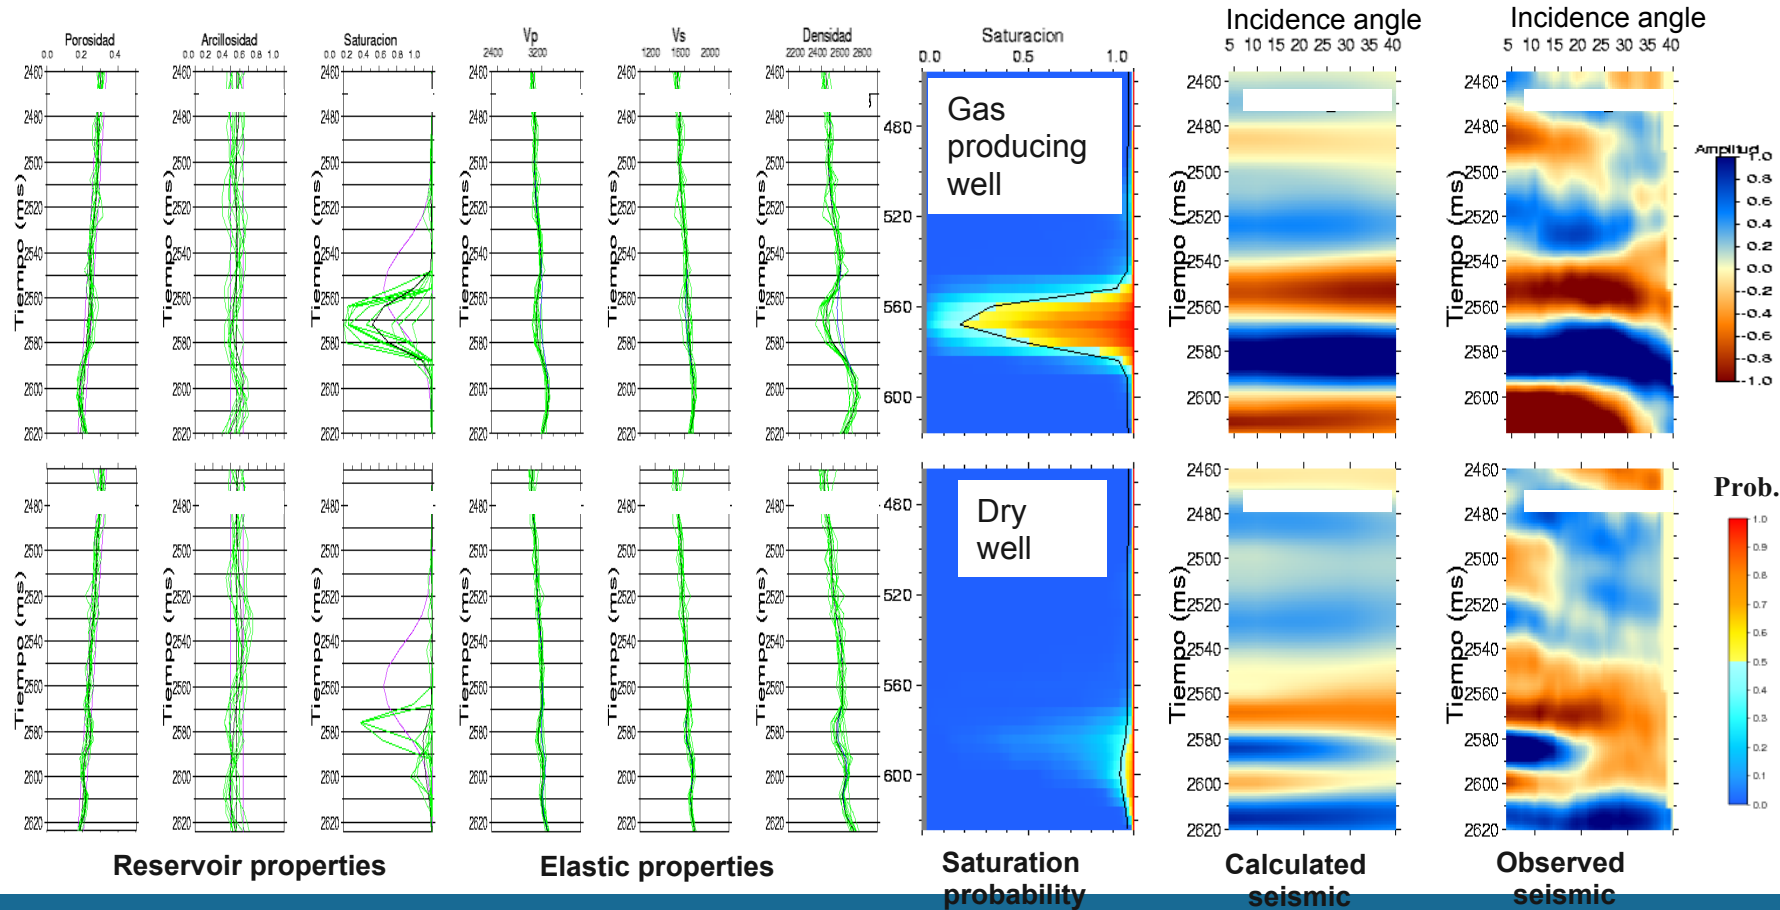

Seismic + wells

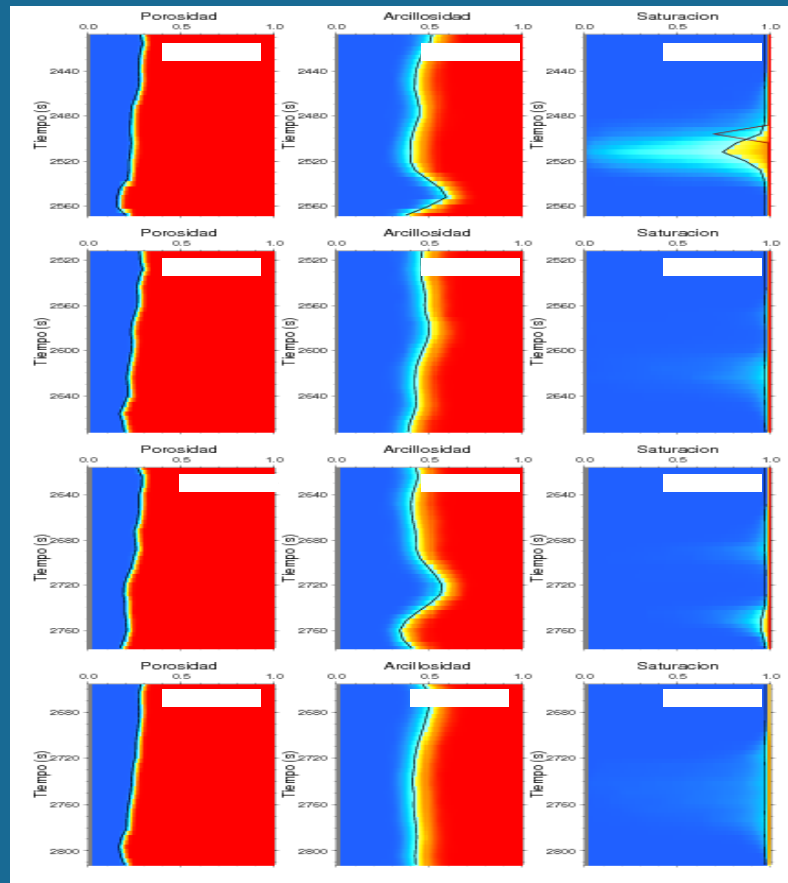

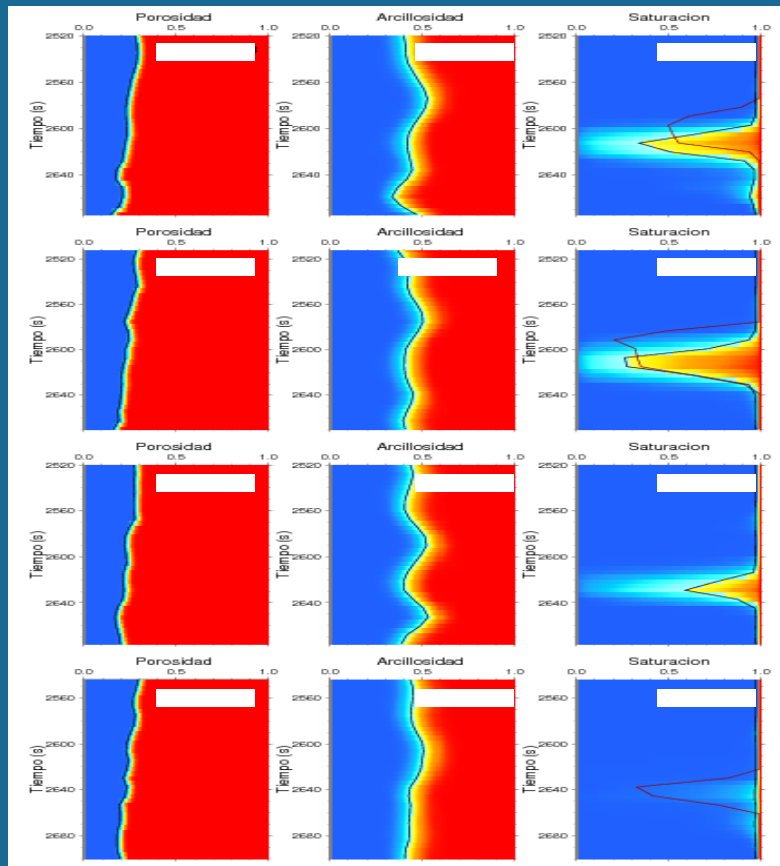

**PETROPHYSICAL SEISMIC  
INVERSION  
(SAMPLING SOLUTION)**

- Targeted investment of **3 M USD**

# FULLY INTEGRATED RESERVOIR:

← ||| 1 year ||| →

- Full development of the reservoir knowledge network codes
- True size reservoir validations

← ||| insertion ||| →

- Insertion in inhouse or commercial setting
- Development of user interfaces
- Development of graphic interfaces
- Cloud and distributed computations

Fast reservoir  
model elaboration  
and update

Smaller number of experts  
Joint procedures  
User over intelligent phones,  
workstations and 3D viewers

# ACKNOWLEDGEMENTS:

Thanks to the following companies and organization for their authorizations to publish our results
